3-1 Journal: Marketing With ePortfolios and Artifact Update

November 24, 2025

Part One

An ePortfolio allows me to present my technical abilities and academic progress in a clear and organized way. Instead of relying solely on a resume, I can show employers real examples of my work, including applications I have built and the logic behind them. This makes my experience more concrete and gives employers confidence in my skills. When I pursue new employment or career advancement, my ePortfolio becomes a practical tool that demonstrates my competencies through finished artifacts.

To maximize the benefits of my ePortfolio while reducing risks, I must carefully control what information I make publicly accessible. This includes removing any sensitive data such as login credentials, private files, or anything proprietary. I can also use screenshots or descriptions when full code disclosure is unnecessary. In addition, I can host certain repositories privately and provide access only upon request. These steps allow me to demonstrate my abilities without compromising my security or professionalism.

Posting intellectual property online presents several risks. Someone could copy or misuse my work without permission. If outdated or unpolished code is included, it may not reflect my current skill level. Employers may also misinterpret academic scaffolding code or think that development shortcuts used in early coursework represent my permanent coding style. To

mitigate these risks, I am selecting only high-quality artifacts, refining each one, and ensuring proper documentation accompanies every enhancement.

So far I have met several course outcomes, including selecting appropriate artifacts for each category, beginning enhancement plans, and making progress on my updates. I have addressed the software design and engineering outcome through my work on the CS 360 Android Inventory App. I have accomplished the algorithms and data structures outcome by selecting and enhancing the CS 300 Advising Assistance Program. I have met the database outcome through the SQLite component of the CS 360 inventory app. The outcomes that remain focus on completing the full enhancements, polishing each artifact to a professional level, and finalizing the ePortfolio for submission.

Part Two

Status Checkpoints for All Categories

Checkpoint	SDE	Algorithms	Databases
Name	CS 360	CS 300	CS 360
Status of IE	In progress	Not started	In progress
Submission Status	Not complete	Not complete	Not complete
Status of FE	Not complete	Not complete	Not complete
Upload to ePort	Not complete	Not complete	Not complete
Status of FePort	Not complete	Not complete	Not complete

Optional Artifact Feedback

If possible, I would appreciate feedback on whether the scope of the SQLite enhancement within the CS 360 app is strong enough to fully meet the database category. I would also appreciate input on whether my planned UI and navigation improvements in the CS 360 artifact are sufficient for demonstrating software design and engineering skills at the capstone level.
